

WORKSHEET 5 SQL

Refer to the following ERD and answer all the questions in this worksheet. You have to write the queries using MySQL for the required Operation.

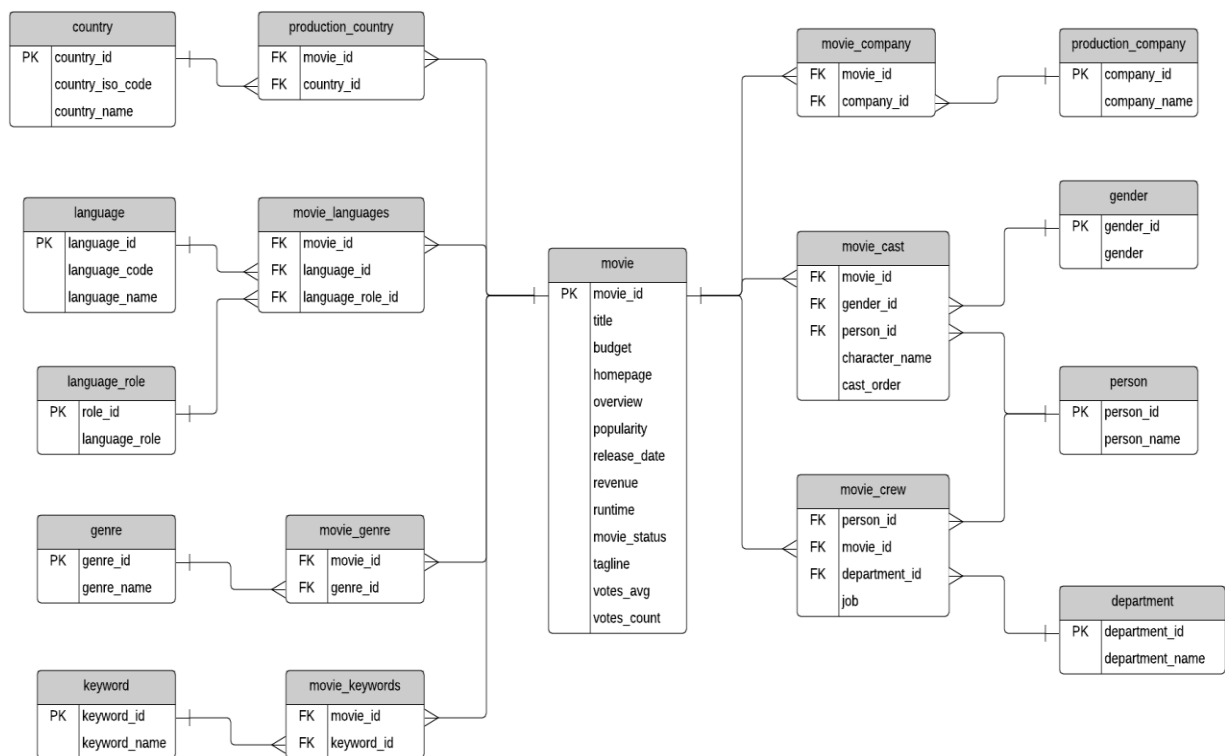

Table Explanations:

- The **movie** table contains information about each movie. There are text descriptions such as title and overview. Some fields are more obvious than others: revenue (the amount of money the movie made), budget (the amount spent on creating the movie). Other fields are calculated based on data used to create the data source: popularity, votes_avg, and votes_count. The status indicates if the movie is Released, Rumoured, or in Post-Production.

WORKSHEET 5 SQL

- The **country** list contains a list of different countries, and the **movie_country** table contains a record of which countries a movie was filmed in (because some movies are filmed in multiple countries). This is a standard many-to-many table, and you'll find these in a lot of databases.
- The same concept applies to the **production_company** table. There is a list of production companies and a many-to-many relationship with movies which is captured in the **movie_company** table.
- The **languages** table has a list of languages, and the **movie_languages** captures a list of languages in a movie. The difference with this structure is the addition of a **language_role** table.
- This **language_role** table contains two records: Original and Spoken. A movie can have an original language (e.g. English), but many Spoken languages. This is captured in the **movie_languages** table along with a role.
- **Genres** define which category a movie fits into, such as Comedy or Horror. A movie can have multiple genres, which is why the **movie_genres** table exists.
- The same concept applies to **keywords**, but there are a lot more keywords than genres. I'm not sure what qualifies as a keyword, but you can explore the data and take a look. Some examples as "paris", "gunslinger", or "saving the world".
- The cast and crew section of the database is a little more complicated. Actors, actresses, and crew members are all people, playing different roles in a movie. Rather than have separate lists of names for crew and cast, this database contains a table called **person**, which has each person's name.
- The **movie_cast** table contains records of each person in a movie as a cast member. It has their character name, along with the **cast_order**, which I believe indicates that lower numbers appear higher on the cast list.
- The **movie_cast** table also links to the gender table, to indicate the gender of each character. The gender is linked to the **movie_cast** table rather than the **person** table to cater for characters which may be a different gender than the person, or characters of unknown gender. This means that there is no gender table linked to the **person** table, but that's because of the sample data.
- The **movie_crew** table follows a similar concept and stores all crew members for all movies. Each crew member has a job, which is part of a **department** (e.g. Camera).

WORKSHEET 5 SQL

1. Write SQL query to show all the data in the Movie table.

Answer: Select * from Movie;

2. Write SQL query to show the title of the longest runtime movie.

Answer: SELECT title, runtime FROM Movie WHERE runtime = (SELECT MAX(runtime) FROM Movie);

3. Write SQL query to show the highest revenue generating movie title.

Answer: SELECT title, revenue FROM Movie WHERE revenue = (SELECT MAX(revenue) FROM Movie);

4. Write SQL query to show the movie title with maximum value of revenue/budget.

Answer: SELECT title, budget FROM Movie WHERE budget = (SELECT MAX(runtime) FROM Movie);

7. Write a SQL query to show all the genre_id in one column and genre_name in second column.

Answer: Select genre_id, genre_name from genre;

8. Write a SQL query to show name of all the languages in one column and number of movies in that particular column in another column.

Answer: Select language_name from Language join Movie_Language on language_name.language_id=movie_id.language_id ;

10. Write a SQL query to list top 10 movies title according to popularity column in decreasing order.

Answer: SELECT title FROM Movie ORDER BY popularity DESC limit10;

12. Write a SQL query to show the names of all the movies which have “rumoured” movie status.

Answer: SELECT title FROM Movie WHERE movie_status= “rumoured” ;

WORKSHEET 5 SQL

13. Write a SQL query to show the name of the “United States of America” produced movie which generated maximum revenue.

Answer: SELECT country_name, country_id FROM country JOIN production_country on movie_id = movie_id.country_id JOIN movie on movie_id WHERE revenue = (SELECT MAX(revenue) FROM Movie AND country_name='United States of America' FROM country);

14. Write a SQL query to print the movie_id in one column and name of the production company in the second column for all the movies.

Answer: Select movie_id from Movie_Componney join Production_Componney on movie_id.componney_id=componney_name.componney_id ;

15. Write a SQL query to show the title of top 20 movies arranged in decreasing order of their budget.

Answer: SELECT title FROM Movie ORDER BY budget DESC limit20;
